SCORING TO PICTURE IN LOGIC PRO

SPOOKY TUNES

Digital Music Production 1 · Unit 6 · reverb & delay buses · sound design · intro deck

GRADES 9–12 · 6 DAYS · 31 PAGES + 16-SLIDE DECK

SPOOKY TUNES

How to use this resource

START HERE

Teacher

WHAT THIS IS ·

A complete 6-day scoring-to-picture project for high school music technology. Students score a one-minute video of a walk through the woods at night in Logic Pro: 32 measures in any key or none, with reverb and delay on shared buses, built from the Logic library, their own microphone recordings and free sound effects. They present their score with the video.

This is Unit 6 of my Digital Music Production 1 course, the first open-ended project of the year. It works just as well on its own, and it fits October as well as November.

QUICK START ·

1. Read the overview and pacing (pages 3–6) and the teacher notes (pages 10–13).
2. Find your video (box on the right) and check the setup list (page 4) on one student computer.
3. Practice the bus demo once (script on page 12, Logic steps on pages 20–21).
4. Cue up the two listening examples on YouTube or Spotify: the Halloween theme (John Carpenter) and the Stranger Things theme (Kyle Dixon & Michael Stein). No audio is included.
5. Print or post the student pages (pages 14–28).

THE INTRO DECK ·

You present it on Day 1 (slides 1–9: hook, what makes music spooky, dry and wet, what a bus is, the reverb and delay bus in Logic) and Day 2 (slides 10–16: minor keys as an option, a worked score, the project, steps, deliverables, rubric). Every slide has speaker notes.

Fonts: the deck uses Oswald and Source Sans 3 (free on Google Fonts, built into Google Slides). If PowerPoint or Keynote shows a different font, install the two fonts or present the PDF copy, which shows the intended look.

WHAT'S INSIDE ·

PART	PAGES	USE
Teacher pages	pages 2–13	How to use, overview, setup, Logic reference, pacing, day plans, teacher notes, bus demo script
Student pages	pages 14–28	Day 1 post, project sheet, How to Bus guide, minor key map + reference, cue sheet, vocabulary, checklist, rubric
Answer key + example	pages 29–30	Worksheet answers and a worked 32-measure score with send levels
Intro deck (separate file)	deck	16 slides, .pptx + PDF, speaker notes on every slide

NO VIDEO IS INCLUDED: YOU SUPPLY ONE

Students score a video of about one minute: a walk through dark woods at night, or any eerie scene. This resource includes no video or audio. Choose one of these:

- **Film your own.** A 60-second phone video walking a dark trail, a foggy field or an empty hallway with a flashlight. No faces needed.
- **A free stock clip.** Royalty-free video sites (for example Pixabay or Pexels) have night-forest clips: search "forest night", "dark woods" or "fog trees". Read the site's license and download one clip for the class.
- **A short menu.** Approve two or three clips and let students choose.

Trim the clip to about 60 seconds first (QuickTime Player › Edit › Trim). At 128 BPM, 32 measures is exactly 60 seconds.

MAKE IT FIT YOUR CLASS ·

- **Less time or less experience?** Pre-build the two buses in a template (page 13).
- **Minor keys are optional.** No key is required; for students who want one, the Minor Key Map and reference card (pages 23–24) teach it.
- **Feedback board:** I use Padlet; any discussion board, LMS forum or paper gallery walk works.

SPOOKY TUNES

Unit overview

OVERVIEW

DMP1 · Unit 6

WHAT STUDENTS MAKE ·

32 measures of atmospheric music scored to a one-minute video of a walk through the woods at night, with reverb and delay routed through shared buses. No key, chord progression or song form is required: any key, or none.

WHAT STUDENTS LEARN ·

Minor keys feel different from major keys, and now they know why. Half steps create dissonance. Reverb creates space and distance. Pitch bending creates unease. Delay creates echo and mystery. Music can tell a story without words. Less can be more: silence and space are creative choices.

WHY IT LANDS HERE ·

This is the first truly open-ended creative project, and it lands after students have chord vocabulary, melodic instincts, form awareness and the beginning of mixing understanding. The video anchor removes the 'what should I make?' anxiety while still demanding genuine creative decisions.

MIXING CONCEPT: REVERB & DELAY VIA BUS ·

Students need reverb to solve a creative problem: how do I make this sound scary? The bus/send workflow is taught as the right way to use time-based effects: 'Put the reverb on a bus, not directly on the track. That way you control how much of it you add.'

A NOTE FROM ME

This project gives students permission to be weird. Some of your most musically undeveloped students will surprise you, because there is no wrong answer, only more or less effective choices. Celebrate the strange ones.

GOALS ·

- Understand what a bus is and why it exists
- Set up a reverb bus and a delay bus in Logic using aux channels and sends
- Use reverb and delay to create a sense of space, distance, and atmosphere
- Find, record, and import sounds from multiple sources: the Logic library, your own microphone recordings, and a free sound-effects site
- Compose music that serves a visual, making deliberate decisions about what happens when in the video
- Score a one-minute video with no structural restrictions: let the video drive the decisions

AT A GLANCE ·

Grades	9–12 (no music reading needed)
Length	6 periods of about 53 minutes: 1 learning, 3 work, 2 finish and present
Type	Open-ended project, scoring to picture
Software	Logic Pro: sends, aux channels, Space Designer, Tape Delay, movie import, markers, automation
Product	A 1-minute, 32-measure score (any key, or none), MP3 + compressed project, a written reflection
Assessment	5-category rubric, /25 (page 28)

STANDARDS ·

Supports the National Core Arts Standards for Music (Music Technology, high school): generating and developing musical ideas (MU:Cr1, MU:Cr2), refining work through feedback (MU:Cr3), presenting (MU:Pr6) and connecting music to other media (MU:Cn11).

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

SPOOKY TUNES

Setup and requirements

SETUP

Teacher

YOU NEED ·

- **A Mac with Logic Pro** for each student. Space Designer, Tape Delay and movie import are built in.
- **Headphones** for every student.
- **A way to record**: an audio interface and microphone (I use a Focusrite Scarlett Solo with a condenser mic), a USB microphone, or in a pinch the Mac's built-in mic. One or two shared stations are enough.
- **A one-minute video** (box on the right).
- **Internet access** to a free sound-effects site, or a folder of sounds you download in advance.
- **Projector and speakers** for the deck, the listening examples and presentations.
- **The two listening examples** from your own YouTube or Spotify access.
- **A place to submit** an MP3 and a .zip, and a **feedback board** for Day 6.

OPTIONAL ·

- **A small MIDI keyboard with a pitch-bend wheel** (an MPK Mini or similar). Pitch bending is one of the spookiest tools in the unit.
- A Logic template with the two buses already built, for students who need it.

NO VIDEO IS INCLUDED: YOU SUPPLY ONE

Students score a video of about one minute: a walk through dark woods at night, or any eerie scene. This resource includes no video or audio. Choose one of these:

- **Film your own.** A 60-second phone video walking a dark trail, a foggy field or an empty hallway with a flashlight. No faces needed.
- **A free stock clip.** Royalty-free video sites (for example Pixabay or Pexels) have night-forest clips: search "forest night", "dark woods" or "fog trees". Read the site's license and download one clip for the class.
- **A short menu.** Approve two or three clips and let students choose.

Trim the clip to about 60 seconds first (QuickTime Player › Edit › Trim). At 128 BPM, 32 measures is exactly 60 seconds.

BEFORE DAY 1 ·

- [ ] Choose, trim and test the video: open it in Logic on one student computer (File › Movie › Open Movie).
- [ ] Practice the bus demo once (page 12). Note 3–4 moments in the video worth pointing out.
- [ ] Test the recording station: interface, mic, input level, headphones.
- [ ] Check that students can reach your chosen sound-effects site, or download a folder of sounds.
- [ ] Cue up the two listening examples; test the projector sound.
- [ ] Print or post the student pages; set up the submission spot and the feedback board.

SPOOKY TUNES

Logic quick reference

SETUP

Teacher

Everything students need in Logic for this unit, in one table. Students get the step-by-step version of the bus setup on the How to Bus pages (19–22).

Import the video	File › Movie › Open Movie. The movie plays in a floating window and a Movie track appears. Make sure the movie starts at bar 1. You can skip importing the movie's own audio.
Tempo	Double-click the tempo in the control bar and type 128 (32 measures = 60 seconds). Other lengths: BPM = 7680 ÷ seconds.
Markers	Show the global tracks (G) to see the Marker track. Move the playhead to a moment and create a marker with Option-' (apostrophe) or the + in the Marker track. Double-click a marker to rename it.
Record a sound	Create an audio track, choose your interface's input, record-enable the track and press R. Keep the level out of the red.
Import a download	Drag the MP3 from Finder into the Tracks area. Logic makes a new audio track.
Reverb bus	On a track's channel strip, click an empty Send slot › Bus › Bus 1. Logic creates an Aux. Put Space Designer on the Aux; Dry 0%, Wet 100%.
Delay bus	Same steps with Bus 2 and Tape Delay (Dry 0%, Wet 100%).
Send level	Drag the small knob in the Send slot. Reverb: start around –15 dB. Delay: start around –20 to –25 dB.
Pitch bend	Use the pitch-bend wheel or joystick on a MIDI keyboard while you record a software instrument part.
Automation	Press A to show automation. Choose the send level in the track's automation menu and draw points to swell the reverb in or out.
Mixer	Press X. Aux channels sit to the right of the track channels.
Export	File › Bounce › Project or Section (Command-B), MP3. In Finder, Control-click the .logicx project and choose Compress. Optional for presenting: File › Movie › Export Audio to Movie.

TEMPO MATH

32 measures × 4 beats = 128 beats. At 128 BPM that is exactly 60 seconds: 1 measure = 1.875 seconds and every 4 measures = 7.5 seconds. For a 64-second clip use 120 BPM; for 75 seconds, about 102 BPM.

VERSION NOTE

Menu names are from current Logic Pro versions; older versions may differ slightly. Logic Pro, Space Designer and Tape Delay are trademarks of Apple Inc., named only to describe what the unit needs. This resource is not affiliated with Apple.

SPOOKY TUNES

PACING

Pacing guide · 6 days (1 learning / 3 work / 2 finish + present)

Teacher

Six class periods of about 53 minutes: one learning day, three work days, then finishing and presenting. Each day's full plan is on pages 7–9.

DAY	FOCUS AND GOAL	MINUTE BLOCKS	SHOW / USE
DAY 1 Learning	**Space is a sound: the bus demo** Every student has a working reverb bus by the end of class. Delay bus setup begins on Day 2.	0–5 · The video 5–15 · Intro deck 15–35 · Bus demo 35–50 · Reverb bus 50–53 · Exit check	Intro deck slides 1–9
DAY 2 Work day	**Delay bus, sounds, moments** Both buses working, at least 5 sounds imported, the video's moments on the cue sheet.	0–10 · Watch again 10–22 · Delay bus 22–30 · Tempo + keys (optional) 30–53 · Sound exploration	Slides 10–11, cue sheet, key map (optional)
DAY 3 Work day	**Experiment, then start scoring** First draft started: the video imported, markers placed, at least half the video (measures 1–16) scored.	0–5 · Near or far? 5–15 · Video + markers 15–50 · Experiment + compose 50–53 · Check-in	Slide 11, worked example
DAY 4 Work day	**Composition: make the moments land** Full video scored, rough mix in place.	0–5 · Make a moment land 5–48 · Compose 48–53 · Rough mix	Project sheet
DAY 5 Finish + present	**Mix, reflect, submit** All projects submitted with a reflection. Early presentations if time allows.	0–30 · Final mix 30–37 · Reflection 37–43 · Export + submit 43–53 · Early presentations	Checklist + rubric
DAY 6 Presenting	**Watch and listen together** Every student plays their score with the video and explains one sound.	0–5 · Feedback questions 5–50 · Presentations 50–53 · Close	Rubric

STUDENT PAGES BY DAY ·

Day 1	Day 1 post (p. 14), How to Bus (pp. 19–20)
Day 2	How to Bus Part 2 (p. 21), Minor Key Map and reference card (optional, pp. 23–24), cue sheet (p. 25), project sheet (pp. 15–17)
Days 3–4	Project sheet steps 4–5, troubleshooting (p. 22), vocabulary (p. 26)
Day 5	Tips and reflection (p. 18), submission checklist (p. 27)
Day 6	Rubric for self-score and teacher score (p. 28)

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

SPOOKY TUNES

Day-by-day plans · Days 1 and 2

DAYS 1–2

Learn + work

DAY 1 · SPACE IS A SOUND: THE BUS DEMO

Learning · Intro deck slides 1–9

Goal: Every student has a working reverb bus by the end of class. Delay bus setup begins on Day 2.

0–5 **THE VIDEO** · Play the woods video for the class. No comment. Then ask: what would you expect to hear if this were a film?

5–15 **INTRO DECK** · The hook (slides 1–3: play two spooky themes from YouTube or Spotify), what makes music spooky, dry vs. wet, and what a bus is (slides 4–6).

15–35 **BUS DEMO** · Teacher-led, students watch with computers closed for building (the 8-step script on page 12, slides 7–9). End by having one student set up the reverb bus from scratch while the class watches.

35–50 **REVERB BUS** · Students open the How to Bus pages and set up their own reverb bus, replicating the demo. Check each setup before anyone moves on.

50–53 **EXIT CHECK** · The one thing to remember: your track still plays dry; the bus adds the wet; the send controls how much.

DAY 2 · DELAY BUS, SOUNDS, MOMENTS

Work day · Slides 10–11, cue sheet, key map (optional)

Goal: Both buses working, at least 5 sounds imported, the video's moments on the cue sheet.

0–10 **WATCH AGAIN** · Play the video again as a class. What moments stood out? Where does the energy shift? Students note 2–3 moments on the cue sheet.

10–22 **DELAY BUS** · Students complete the delay bus. Walk around and check every student's Space Designer settings: confirm 100% wet before moving on.

22–30 **TEMPO + KEYS (OPTIONAL)** · Set the project tempo (128 BPM for a 60-second clip). Slide 10: no key is required; students may work in any key or none. Anyone who wants a darker harmonic home can pick a minor key on the Minor Key Map.

30–53 **SOUND EXPLORATION** · Students browse the Logic library, record something with the microphone, and download a free sound. Goal: at least 5 sounds in the project before any composition decisions.

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

DAY 3 · EXPERIMENT, THEN START SCORING

Work day · Slide 11, worked example

Goal: First draft started: the video imported, markers placed, at least half the video (measures 1–16) scored.

0–5 **NEAR OR FAR?** · Mini-lesson: one sound, send low then high. Which feels closer? Some sounds close and dry, some distant and wet.

5–15 **VIDEO + MARKERS** · Import the video, set the tempo, add markers at the moments from the cue sheet.

15–50 **EXPERIMENT + COMPOSE** · Students experiment with the effects and begin placing sounds against the video. Stuck? 'Send one sound to the reverb bus at maximum. Now pull it back slowly. Where does it start to feel right? That is your send level.'

50–53 **CHECK-IN** · Every student plays you measures 1–16 with the video.

DAY 4 · COMPOSITION: MAKE THE MOMENTS LAND

Work day · Project sheet

Goal: Full video scored, rough mix in place.

0–5 **MAKE A MOMENT LAND** · Mini-lesson: pick the biggest moment in the video and make the music change right there: a new sound, a drop to silence, a reverb swell. Students working in a key can move the drone or bass to a new root.

5–48 **COMPOSE** · Students continue composing to the video. Circulate and ask every student to play their piece with the video. Does the music respond to what is on screen? If it feels like background noise, push them to acknowledge specific moments.

48–53 **ROUGH MIX** · Pull every fader back a little; nothing in the red. Save a copy.

CIRCULATING PROMPTS

- 'Play it for me with the video. Where is the music doing something because of what's on screen?'
- 'Which sound is closest to us? Which is farthest away? How did you make that happen?'
- 'What is the biggest moment in the video, and what does your music do right there?'

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

SPOOKY TUNES

Day-by-day plans · Days 5 and 6

DAYS 5–6

Finish + present

DAY 5 · MIX, REFLECT, SUBMIT

Finish + present · Checklist + rubric

Goal: All projects submitted with a reflection. Early presentations if time allows.

0–30 **FINAL MIX** · Students finalize their mix. Reverb and delay levels adjusted. Nothing clipping.

30–37 **REFLECTION** · Two specific techniques used to create atmosphere, and why (page 18).

37–43 **EXPORT + SUBMIT** · Bounce an MP3, compress the .logicx, submit both. Optional: export the audio into a copy of the movie.

43–53 **EARLY PRESENTATIONS** · Volunteers play their piece with the video.

DAY 6 · WATCH AND LISTEN TOGETHER

Presenting · Rubric

Goal: Every student plays their score with the video and explains one sound.

0–5 **FEEDBACK QUESTIONS** · Students post three feedback questions to the class board before class begins.

5–50 **PRESENTATIONS** · Each student plays their piece with the video. Classmates watch both together. Ask each presenter: pick one sound in your piece and explain why you chose it and what you did to it. About 2–3 minutes each.

50–53 **CLOSE** · 'Scoring to picture is one of the most in-demand skills in music production. Film, TV, games, ads: all of it is this.'

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

WHAT THIS UNIT DOES ·

This is the first open-ended project in DMP1. After four units of structured constraint, students get their first taste of genuine creative freedom. The spooky theme and the fixed video brief give just enough structure to prevent paralysis (students know what they are making and roughly how long it needs to be), but there are no chord-progression or song-form requirements. The brief is: make something that sounds like this video looks.

The primary technical goal is bussing. This is the first formal introduction to routing in Logic and students consistently find it confusing. The unit gives you 6 days partly because the effects processing is worth exploring, but also because some students will need multiple attempts to get the bus routing right before they can focus on the creative work.

The combination of bussing, an open brief and video scoring makes this unit pedagogically rich. Students who have been cautious and mechanical in previous units often surprise themselves here. The absence of rules removes the fear of being wrong.

KEYS ARE OPTIONAL ·

No key is required. A student may work in any key, or in none: atonal and sound-effect scores are welcome. Minor keys are offered as a tool, not a rule: they sound darker, and some students like a harmonic home or a change of key at a big moment in the video. For them, the Minor Key Map (page 23) teaches the minor scale and its first chord, and the reference card (page 24) gives eight keys ready to use.

HOW THIS KIT DIFFERS FROM MY CLASSROOM VERSION

- No video is included: you supply a one-minute clip (page 4).
- The 32-measure length and the written reflection come from my course restructure; the rubric is my original, with no key criteria.
- Equipment and websites are named as examples; any interface, microphone and free sound-effects site works.

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

COMMON STUDENT STRUGGLES ·

Space Designer not set to 100% wet: The single most common error. If Space Designer is outputting any dry signal, students will hear double: the dry signal from the track AND the dry signal from the bus. The bus should be 100% wet. Walk around on Day 2 and check every student's Space Designer settings before anything else.

Wrong bus number on the Aux input: Students create an Aux channel by hand but forget to set its input to a bus, or set it to the wrong bus number. Show them explicitly: the Aux input must match the bus number on the send. Bus 1 sends to Bus 1. If they do not match, nothing happens. Creating the bus from a track's Send slot (as the How to Bus pages do) avoids most of this.

Not hearing any reverb at all: Usually means the Aux channel fader is all the way down, or the send level is at its lowest. Check both. The send knob needs to be turned up and the Aux fader needs to be at a reasonable level.

Blank page paralysis on the creative side: Some students freeze without harmonic or structural constraints. The redirect: download three sounds you find unsettling, import them into Logic, and just play. You do not need a plan yet. The plan emerges from the sounds.

Everything drenched in reverb equally: Students discover reverb and apply maximum amounts to every track. The result is an undifferentiated wash. Prompt them: some sounds should feel close and dry, some should feel distant and wet. The contrast is what creates space.

The big moment nobody hears: Students change something at a big moment in the video (a new melody, a new key) but leave the drone or bass untouched, so nothing seems to change. Have them change the lowest sound at the same moment (move it, drop it out, or let silence in), and place that moment on a cut or a shift in the video.

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

DAY 1: THE BUS DEMO (20 MINUTES) ·

This is teacher-led. Students watch first, then replicate. Here is a suggested sequence.

1. Open a new Logic project. Add 3 or 4 audio or instrument tracks with different sounds playing.
2. Play the project. Ask: what if I want all of these to sound like they are in the same room? I could add reverb to each track individually, but then I have three separate reverbs to manage. Show this briefly: add Space Designer to one track, then copy it to another. Ask: what is the problem here? (Any change to one reverb does not affect the other.)
3. Delete the individual reverbs. Open the Mixer (X). On the first track, click an empty Send slot and choose Bus 1: Logic creates an Aux channel. Rename it Reverb Bus.
4. Check that the Aux input reads Bus 1. Add Space Designer to the Aux insert. Set it to 100% wet (Dry 0%).
5. Turn that track's send up. Play the project. Ask: what do you hear? What changed?
6. Add sends to the other tracks at different levels. Ask: what happens when one track has a high send and another has a low send? (Different apparent distance.) This is the moment the concept lands.
7. Ask: what would happen if I wanted a delay too? Walk through setting up Bus 2 with Tape Delay. The second setup goes faster: students now understand the pattern.
8. Open the project on a student computer and ask a student to set up the reverb bus from scratch while the class watches. This is the most effective check for understanding.

ABOUT THE VIDEO ·

Before playing it for students, watch your clip yourself and identify 3–4 moments worth noting: a visual cut, a shift in lighting, a moment of stillness. These are the compositional opportunities you will point students toward during working days.

Play the video for the full class at the start of Day 1 and again at the start of Day 2. Watch it once without comment, then watch it again and ask: what moments stood out? What did you expect to hear? This primes students to think cinematically before they open Logic.

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

SUGGESTED VARIATIONS ·

More accessible: Pre-build the reverb and delay buses in a Logic template and distribute it. Students open the template and focus on sound collection and composition rather than routing. The How to Bus pages become a reference for understanding what is already built rather than a setup guide.

More advanced: Challenge students to automate the send level on at least one track so the reverb swells in or out at a specific moment in the video. Introduce the idea of a wet/dry blend that changes over time as a compositional tool. Or, as an extra challenge, try a half-step key change (A minor to B-flat minor) at the scariest moment.

GRADING TIPS ·

- Each category is scored 2–5, for a total out of 25. Students self-score first; you score in the second column (page 28).
- Watch once with the video for Composition & Pacing (are key moments acknowledged? is silence used on purpose?), once eyes-closed for Sound Design and Reverb & Delay (near and far), then open the Mixer to check both buses, 100% wet, and the sends.
- The reflection is the quickest evidence of intention: two named techniques with a reason each.

RESOURCES ·

- The intro deck (.pptx and PDF), included.
- Listening: the Halloween theme (John Carpenter) and the Stranger Things theme (Kyle Dixon & Michael Stein), from your own YouTube or Spotify access. A search for spooky hip-hop instrumentals or horror film scores gives more.
- A free sound-effects site you approve, and a short Logic “bus and send” tutorial video if you like one.

OBSERVATION NOTES ·

What worked, what to adjust, and anything worth remembering for next year.

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

SPOOKY TUNES · DAY 1

Digital Music Production 1 · Unit 6

Today you are learning how to bus. Watch the demo first. Then replicate it yourself using the How to Bus pages.

Do not start building your Spooky Tunes project until your reverb bus is working.

1. **WATCH THE VIDEO** · Your teacher will play the woods video. Watch it without doing anything.
   What would you expect to hear? What moments stand out? You will be scoring this video for the next 6 days.

2. **WATCH THE DEMO** · Your teacher will build a reverb and delay bus live in Logic. Watch carefully. Do not open your own computer for building yet.
   The demo shows you exactly what you are about to do. Pay attention to the order of steps.

3. **OPEN THE HOW TO BUS PAGES** · Find How to Bus (pages 19–22) and keep it visible next to Logic.
   Every step you need is there. If something is not working, check the troubleshooting table before asking for help.

4. **SET UP YOUR REVERB BUS** · Follow Part 1 step by step. Click an empty Send slot, choose Bus 1, add Space Designer at 100% wet on the new Aux, and raise the send.
   Call your teacher over to check your setup before moving on to the delay bus.

5. **SET UP YOUR DELAY BUS** · Follow Part 2. Click a Send slot, choose Bus 2, add Tape Delay at 100% wet.
   You do not need to add more delay sends today. Just get it set up and working.

THE ONE THING TO REMEMBER ABOUT BUSES

Your original track still plays dry. The bus adds the wet (effected) signal on top. The send knob on your track controls how much signal goes to the bus.

Space Designer on the bus must be set to 100% wet. If it is outputting any dry signal, you will hear everything doubled.

MOMENTS I NOTICED IN THE VIDEO

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

PROJECT SHEET

Digital Music Production 1 · Unit 6 · Open-Ended · 6 Days · Reverb & Delay via Bus

OVERVIEW ·

This is your first open-ended project. There is no chord progression required. No song form required. No right answer. Your brief is a one-minute video of a walk through the woods at night, and your job is to score it. The music should make the video feel the way it looks. Use any sounds you can find or record. Experiment. Make something unsettling.

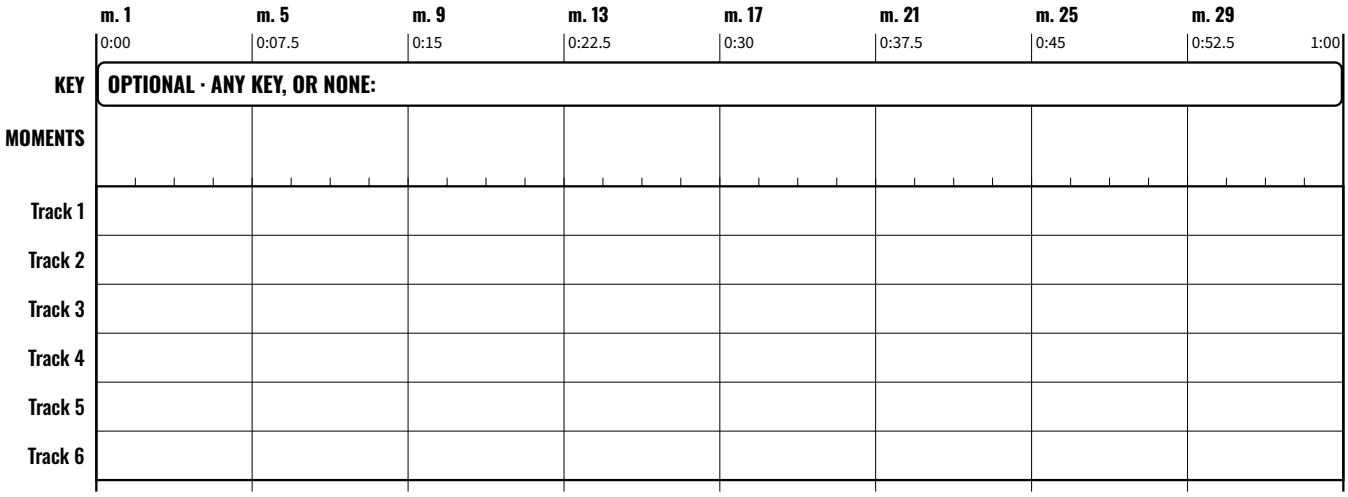

The new technical skill in this unit is bussing: routing reverb and delay through shared aux channels so multiple tracks share the same effect. Your teacher will demo this on Day 1. The How to Bus pages walk you through the setup step by step.

GOALS ·

- Understand what a bus is and why it exists
- Set up a reverb bus and a delay bus in Logic using aux channels and sends
- Use reverb and delay to create a sense of space, distance, and atmosphere
- Find, record, and import sounds from multiple sources: the Logic library, your own microphone recordings, and a free sound-effects site
- Compose music that serves a visual, making deliberate decisions about what happens when in the video
- Score a one-minute video with no structural restrictions: let the video drive the decisions

THE BRIEF

1 VIDEO · ABOUT 60 SECONDS · 32 MEASURES · 128 BPM · ANY KEY OR NONE

Your score map: 32 measures, about one minute. Vocabulary: page 26. Rubric: page 28.

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

SPOOKY TUNES

Project sheet · requirements and sound sources

STUDENT

REQUIREMENTS ·

- [ ] Reverb bus set up correctly in Logic: aux channel, Bus 1, Space Designer at 100% wet
- [ ] Delay bus set up correctly in Logic: aux channel, Bus 2, Tape Delay or Echo at 100% wet
- [ ] At least 3 tracks sending to the reverb bus
- [ ] At least 1 track sending to the delay bus
- [ ] Minimum 5 distinct sound sources (a combination of the Logic library, your own recording, and a free download)
- [ ] At least 1 original recording made with a microphone
- [ ] At least 1 sound downloaded from a free sound-effects site (such as pixabay.com) and imported into Logic
- [ ] Music composed to the full length of the video: 32 measures, about 1 minute
- [ ] No empty silence longer than 5 seconds unless it is a deliberate compositional choice
- [ ] Project named: Your Name – Spooky Tunes
- [ ] Exported as MP3 and .zip (compressed .logicx file) and submitted to your class page before presenting
- [ ] A short written reflection: two specific techniques you used to create atmosphere, and why you chose them

SOUND SOURCES ·

You have three places to find sounds for this project. Use all three.

Logic Pro library	Open the Loop Browser (O) or the Library. Search by keyword: try “dark”, “tension”, “drone”, “cinematic”, “wind”, “impact”. You are not limited to loops: individual one-shots and samples work well for SFX layers.
Your own recording	Record your own sounds in the room. Scratch a surface. Close a door slowly. Tap something hollow. Crumple paper. Hum. Any recorded sound can become something unsettling with enough processing. Drag the recording into Logic and apply effects.
A free download	Go to a free sound-effects site your teacher approves (for example pixabay.com › Sound Effects) and search for atmospheric or horror sounds. Download as MP3, then drag the file from your Downloads folder into the Tracks area to create a new audio track. Check the site’s license.

Project sheet · composing to picture and steps

STUDENT

COMPOSING TO PICTURE ·

Scoring to a video is different from writing music for its own sake. The video tells you what to do and when. Before you build anything, watch the video twice and take notes.

Watch before you build	Play the video twice without touching Logic. What moments stand out? Where does the energy change? What would a sound do to that moment? Write notes on your cue sheet before you open a single plugin.
Mark your moments	Add markers in Logic at the timestamps where you want something to happen. A footstep. A sudden silence. A swell. Having the map in advance stops you from improvising past the moments that matter.
Silence is a tool	If nothing is playing for a moment and then a sound enters, the entry feels enormous. Silence is not dead air: it is tension. Use it deliberately.
Let the video breathe	You do not need to fill every second with sound. Sparse music over a quiet visual can be more unsettling than a wall of noise. Less is often more here.
Match the energy	If the video gets more intense, your music should respond. Build toward moments of tension and release from them. The reverb and delay buses will help: a swell of wet reverb signals that something is coming.

STEPS / PROCESS ·

1. ### DAY 1 · WATCH THE VIDEO
   Watch it twice without doing anything. What moments stand out? Where does the energy shift? Make notes on your cue sheet before touching Logic.

2. ### DAYS 1–2 · SET UP YOUR BUSES
   Follow the How to Bus pages to set up your reverb bus (Bus 1, Space Designer) and delay bus (Bus 2, Tape Delay). Get both working before you start collecting sounds.

3. ### DAY 2 · FIND AND IMPORT SOUNDS
   Browse the Logic library, record at least one original sound, and download at least one free sound. Drag everything into Logic. Do not worry about arrangement yet.

4. ### DAY 3 · EXPERIMENT WITH EFFECTS
   Before you score the video, spend time just playing. Send sounds to the reverb and delay buses at different levels. What does a heavy reverb do to a footstep? What does a long delay do to a single note? Let yourself be surprised.

5. ### DAYS 3–4 · SCORE THE VIDEO
   Import the video and add markers at your key moments. Place sounds against the video. Adjust send levels so the wet/dry balance serves the mood. Build toward tension, release from it.

6. ### DAY 5 · MIX, REFLECT AND SUBMIT
   Play the full piece with the video. Does the music serve what is on screen? Adjust volumes. Make sure nothing is clipping. Write your reflection. Export MP3 and .zip and submit before presenting.

SPOOKY TUNES

Project sheet · tips and reflection

STUDENT

Name _____ Date _____

TIPS FOR SUCCESS ·

- Set up the buses first. Do not start collecting sounds until both buses are working. If you build 10 tracks and then realize your bus routing is wrong, you have to fix everything.
- Record something weird. The microphone is there: use it. A recording of your own voice processed beyond recognition is more interesting than any preset.
- Want it darker? Any key, or no key at all, is fine, but a minor key sounds darker than major: try one (the Minor Key Map shows how). Half steps are spooky too: try two notes a half step apart, or slide between them with the pitch-bend wheel.
- Atonal does not mean random. Even without a key, your sounds should feel like they belong together. Choose notes for texture and tension, not just because they sound unpleasant.
- Watch the video with your music at least once per working day. It is easy to lose track of whether you are actually serving the picture or just making a piece of music that happens to be playing at the same time.
- Keep the How to Bus pages open. If your routing stops working, the troubleshooting table will fix almost every common problem.

MY REFLECTION ·

Name two specific techniques you used to create atmosphere and explain why you chose them. Not “I used reverb”, but “I sent the wind to the reverb bus at –6 dB so it sounds like the whole forest, and kept the footsteps dry so they feel close.”

TECHNIQUE 1

What I did (name the sound, the effect or the moment): _____

_____

Why I chose it (what it does to the video): _____

_____

TECHNIQUE 2

What I did (name the sound, the effect or the moment): _____

_____

Why I chose it (what it does to the video): _____

_____

Keep these pages open next to Logic while you work.

WHAT IS A BUS, AND WHY DOES IT EXIST? ·

A bus is a shared channel that multiple tracks can send their audio to. Instead of putting a reverb plugin on every single track individually, you create one reverb bus and send as many tracks as you want to it. The reverb lives in one place. Everything that sends to it gets the same reverb. This matters for three reasons:

- **Consistency:** every track that sends to the bus sounds like it exists in the same space.
- **Control:** one fader on the bus controls how much reverb everything gets at once.
- **Efficiency:** one plugin instead of ten. Less CPU. Less mess.

THE SEND / RETURN RELATIONSHIP

Your original track still plays dry: you always hear the unaffected signal. The send knob controls how much of that signal gets routed to the bus. The bus adds wet signal (the effect) on top. Turn the send up: more reverb. Turn it down: less. The original track is unchanged.

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

PART 1 · SET UP YOUR REVERB BUS ·

Start from the track you want to add reverb to, not from a blank aux channel. Logic creates the bus automatically when you make the send.

1 OPEN THE CHANNEL STRIP FOR YOUR TRACK

In the Mixer (X) or the inspector on the left, find the channel strip for the track you want to add reverb to. Look for the Sends section: it sits below the insert plugin slots.

If you cannot see Sends, widen the inspector or the Mixer so the Sends slots show.

2 CLICK AN EMPTY SEND SLOT AND CHOOSE A BUS

In the Sends section, click one of the empty slots. A menu appears. Go to Bus and choose Bus 1 (any bus that shows no name next to it is empty).

Watch what happens: Logic automatically creates an Aux channel strip routed to that bus. You do not need to create it manually.

3 RAISE THE SEND LEVEL

A small knob now appears in the send slot. At its lowest, nothing is going to the bus. Click and drag it upward. Start around –15 dB.

This is the most critical step. A send knob at its lowest sends nothing. Nothing will happen until you raise it.

4 ADD SPACE DESIGNER TO THE AUX CHANNEL

Find the Aux channel Logic just created in the Mixer. Click its first empty Insert slot and choose Reverb › Space Designer. For Spooky Tunes, try a large hall, cathedral or other large-space preset.

The Aux channel may appear at the far right of the Mixer. Scroll if you cannot find it.

5 SET SPACE DESIGNER TO 100% WET

Inside Space Designer, set the Dry signal to 0% and the Wet signal to 100%. The bus outputs only the reverb. The dry signal always comes from the original track.

This is the most common mistake. If the plugin is partially dry, you hear the sound doubled. Always 100% wet on a bus plugin.

6 NAME THE AUX CHANNEL

Double-click the name at the bottom of the Aux channel strip and type REVERB BUS.

You only set this up once. Every other track that needs reverb just needs a send pointing to the same bus number.

7 SEND MORE TRACKS TO THE SAME BUS

Select another track. Click an empty Send slot. Choose the same bus number as before. Raise the send level. That track now shares the reverb.

Do not pick a new bus number for each track. All reverb sends point to the same bus.

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

PART 2 · SET UP YOUR DELAY BUS ·

Same process as the reverb bus: start from the track, click a Send slot, choose an empty bus, and Logic creates the Aux. Do this after your reverb bus is confirmed working.

1 CLICK A SEND SLOT AND CHOOSE A NEW BUS

On any track you want delay on, click an empty Send slot. Choose Bus › Bus 2 (or whichever bus is still empty, not the one used for reverb). Logic creates a second Aux channel.

You can send a track to both the reverb bus and the delay bus at the same time by adding two separate sends.

2 RAISE THE SEND LEVEL

Drag the send knob up. Start lower than your reverb send: delay is a more noticeable effect. Around –20 to –25 dB is a good starting point.

Delay is easy to overdo. Less is almost always better.

3 ADD TAPE DELAY TO THE AUX CHANNEL

Find the new Aux channel in the Mixer. Click its first Insert slot and choose Delay › Tape Delay. Set the plugin to 100% wet (Dry at 0%): same rule as the reverb bus.

Try Echo for a cleaner sound or Stereo Delay for a wider effect.

4 NAME THE AUX CHANNEL

Double-click the channel name and type DELAY BUS.

You now have two clearly named effect buses.

5 ADJUST THE DELAY TIME

In Tape Delay, the delay time controls the gap between the original and its echo. For atmosphere, try longer times (600–900 ms) with higher feedback. For subtle movement, try shorter times (100–250 ms) with low feedback.

Turn off tempo sync if you want the delay to float freely. Free-running delay often feels more unsettling.

6 BALANCE REVERB AND DELAY TOGETHER

Play the full project and listen to both effects. Reverb creates space. Delay creates movement. Use the fader on each Aux to balance the total effect amount. You can even send the delay bus to the reverb bus by adding a send on the delay's Aux channel.

A common approach: reverb on most things, delay on just one or two specific elements. Selective delay draws the ear.

SPOOKY TUNES

How to Bus · troubleshooting and atmosphere

TROUBLESHOOTING ·

PROBLEM	FIX
I hear reverb, but the whole track sounds wet, with no clear dry sound	Space Designer is not set to 100% wet. Open it and set Dry to 0%, Wet to 100%.
I turned up the send but I can't hear any reverb	Check that the Aux input is set to the same bus number as the send (Bus 1 for reverb, Bus 2 for delay). Also check that the Aux fader is turned up.
Everything sounds like it's drowning in reverb	Your send levels are too high, or your Space Designer decay is too long. Pull the send knobs down (try –20 dB) and shorten the reverb tail. Or… did you put reverb on the Stereo Out by accident?
The delay is syncing to tempo in a weird way	Tape Delay has a tempo sync option. Turn it off and set the time manually in milliseconds if you want free-running delay.
I put reverb directly on a track instead of using the bus	Delete the plugin from the track's insert, set up the bus as above, and use a send instead.

USING REVERB & DELAY FOR ATMOSPHERE ·

Heavy reverb on a quiet sound	A faint, distant sound buried in reverb feels enormous, like something very far away in a large, empty space. Try a single low note with a long reverb tail.
Delay on a single hit	One sharp sound with a long delay feels like an echo in an empty corridor. High feedback makes it cascade and fade. Low feedback gives one clean echo.
Reverb on a recording	Record something yourself (your voice, a tap on a surface, a door creak) and send it to the reverb bus. Real recordings with heavy processing sound genuinely unsettling.
Different send levels	Not everything needs the same amount of reverb. A close, dry sound next to a distant, wet sound creates depth and a sense of physical space.
Automate the send level	Turn the send up gradually over 8 measures and the reverb swells in. Pull it out suddenly and the space collapses. Both are effective in different moments of the video.

CHECK YOURSELF · ANSWERS ON PAGE 29

1. On a bus, Space Designer is set to _____ wet. _____
2. The Aux input must match _____. _____
3. A send knob at its lowest sends _____ to the bus. _____
4. To make a sound feel far away, turn its reverb send _____. To make it feel close, _____. _____

SPOOKY TUNES

Minor key map · optional

STUDENT

Optional · reference p. 24

Name _____ Date _____

This page is optional. Your project does not need a key: any key, or none, is fine, and atonal or sound-effect scores are welcome. Want a darker sound? Try a minor key. Some composers also change key at a big moment in the video.

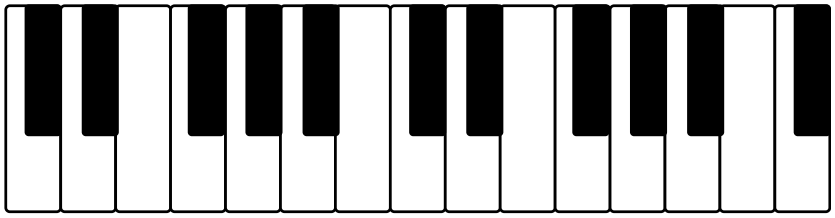

THE RECIPE

Minor scale: start on any key, then go up Whole, Half, Whole, Whole, Half, Whole, Whole (a half step is the very next key, black or white; a whole step skips one). **First minor chord:** scale notes 1, 3 and 5 (root, third, fifth).

Spooky tip: the half steps in a minor scale sit between notes 2–3 and 5–6. Play them together and they rub.

My key: _____ minor

	ROOT	THIRD	FIFTH				
FIRST MINOR CHORD							
MINOR SCALE							

Colour or circle the chord. Put a dot on every scale note.

A second key (only if I change key): _____ minor

	ROOT	THIRD	FIFTH				
FIRST MINOR CHORD							
MINOR SCALE							

Colour or circle the chord. Put a dot on every scale note.

IF YOU CHANGE KEY: PAIRS TO TRY

A minor › D minor: Smooth: they share six of seven notes, so the change feels like the path turning.

A minor › Bb minor: A lurch: everything moves up a half step. Use it at the scariest moment.

E minor › A minor: Darker and lower: a good choice when the video slows down or goes still.

Key vocabulary

STUDENT

14 words

Name _____ Date _____

Read each word and its meaning. In the last column, write where you used it in your own project.

WORD	MEANING	IN MY PROJECT
Bus	a shared channel that multiple tracks send their audio to; effects on the bus apply to everything that sends to it	
Aux channel	the channel in Logic that acts as the bus destination; this is where you put the reverb or delay plugin	
Send	a control on a track that routes some of its signal to a bus; turning it up sends more signal to the effect	
Dry signal	the original, unaffected sound: no reverb, no delay	
Wet signal	the processed sound, with reverb or delay applied	
Reverb	a simulation of acoustic space; makes sounds feel like they exist in a room, hall, cave, or open air	
Decay	how long the reverb tail lasts after the original sound ends; longer decay = larger-feeling space	
Delay	an effect that repeats a sound after a set amount of time, like an echo	
Feedback	in a delay, how many times the echo repeats before fading out; high feedback = many repeats	
SFX	sound effects: non-musical sounds used to create atmosphere, texture, or narrative	
Atonal	music that does not follow a key or scale; notes chosen for texture and feeling rather than harmonic function	
Minor key	the set of notes in a minor scale; it usually sounds darker than a major key	
Half step	the smallest distance on the keyboard, from one key to the very next; two notes a half step apart rub against each other	
Scoring to picture	writing music for a video, with sounds placed at specific moments on screen	

QUICK CHECK

A bus plugin at 100% wet outputs only the _____ signal. _____

Longer reverb decay = a _____-feeling space. _____

High delay feedback = _____ repeats. _____

In A minor, the half steps are B–C and _____. _____

Submission checklist

STUDENT

Before you present

Name _____ Date _____

Tick each box before you submit and present. If a box isn't ticked, you aren't done yet.

- ☐ Reverb bus set up correctly (Aux, Bus 1, Space Designer at 100% wet)
- ☐ Delay bus set up correctly (Aux, Bus 2, Tape Delay or Echo at 100% wet)
- ☐ At least 3 tracks sending to the reverb bus
- ☐ At least 1 track sending to the delay bus
- ☐ Minimum 5 distinct sound sources used
- ☐ At least 1 original microphone recording included
- ☐ At least 1 free downloaded sound imported
- ☐ Music composed to the full length of the video (32 measures, about 1 minute)
- ☐ Project named: Your Name – Spooky Tunes
- ☐ Exported as MP3 and .zip (compressed .logicx) and submitted before presenting
- ☐ Reflection written: two techniques and why
- ☐ Three feedback questions posted to the class feedback board before presenting

MY THREE FEEDBACK QUESTIONS ·

Ask about something you really want to know. Example: "Does the silence before the cut make the next sound feel bigger?"

1. _____
2. _____
3. _____

SPOOKY TUNES

Rubric

RUBRIC

/ 25

Name _____ Date _____

Score each category from 2 to 5. Score yourself first, then your teacher scores.

Category	2	3	4	5	Self	Teacher
SOUND DESIGN & ATMOSPHERE	Fewer than 3 sound sources used. Sounds feel generic or unrelated to the visual. No sense of atmosphere.	At least 3 sound sources used but choices feel arbitrary. Some atmospheric quality but inconsistent.	At least 5 sound sources including an original recording and a free download. Sounds contribute to a consistent spooky atmosphere.	Sound choices are intentional and varied. The combination of sources creates a genuinely unsettling atmosphere that serves the video at every moment.		
COMPOSITION & PACING	Music does not respond to the video. Sounds placed arbitrarily. Long stretches of silence or constant unvarying noise.	Some response to the video but key moments are missed or poorly timed. Music feels like it is playing alongside the video rather than for it.	Music responds to the video at most key moments. Energy builds and releases appropriately. No unintentional dead air.	Music serves the picture precisely. Key moments are acknowledged. Silence is used as a compositional tool. The piece feels like it was written for this specific video.		
TECHNICAL SKILL / DAW USE	Bus routing not set up or set up incorrectly. Space Designer and Tape Delay not at 100% wet. Sends not used.	Bus routing partially correct. At least one bus working but setup has errors. Some sends used but inconsistently.	Both buses set up correctly. Sends used on multiple tracks. Wet/dry balance adjusted by ear.	Both buses set up correctly and used with intention. Send levels vary between tracks to create spatial depth. Workflow is organized and confident.		
REVERB & DELAY AS MIX	Effects not used to create space or depth. Everything either fully dry or drenched indiscriminately.	Effects present but applied uniformly. No sense of near/far or spatial relationship between elements.	Reverb and delay used to place sounds at different perceived distances. Mix has some sense of depth and space.	Effects used to create a convincing sense of physical space. Near elements are dry, distant elements are wet. Reverb and delay contribute to the atmosphere rather than just processing the sound.		
DOCUMENTATION & PRESENTATION	Project not submitted or not presented.	Project submitted late or named incorrectly. Presentation made with minimal engagement.	Project named correctly and submitted. Presentation made. Feedback questions posted. Reflection written.	Project correctly named, submitted on time. Student presents with confidence and can explain their sound choices and how the effects serve the atmosphere. Three thoughtful feedback questions posted.

D MINOR · WORKED EXAMPLE, M. 17–32

Chord (root, third, fifth): D · F · A **Scale:** D E F G A Bb C

HOW TO BUS · CHECK YOURSELF ·

1. 100% (Dry at 0%)

2. the bus number chosen on the send (Bus 1 for reverb, Bus 2 for delay)

3. nothing

4. up; turn it down (keep it mostly dry)

VOCABULARY · QUICK CHECK ·

1. wet

2. larger

3. many

4. E–F

CUE SHEET · TEMPO MATH ·

At 128 BPM: 0:30 = measure 17 · 0:45 = measure 25 · 0:12 = measure 7. Tempo for other lengths (7680 ÷ seconds): 60 s = 128 BPM · 64 s = 120 BPM · 75 s = 102 BPM (75 s gives 102.4; round to 102).

CHECKING THE BUSES IN A STUDENT PROJECT

Open the Mixer (X). Two Aux channels named REVERB BUS (input Bus 1, Space Designer) and DELAY BUS (input Bus 2, Tape Delay or Echo), each plugin at 100% wet. At least 3 tracks show a Bus 1 send above its lowest setting and at least 1 shows a Bus 2 send. No reverb or delay plugin sits directly on a track's inserts.

© 2026 Brian Lotze · Hudson Beat · For single-classroom use

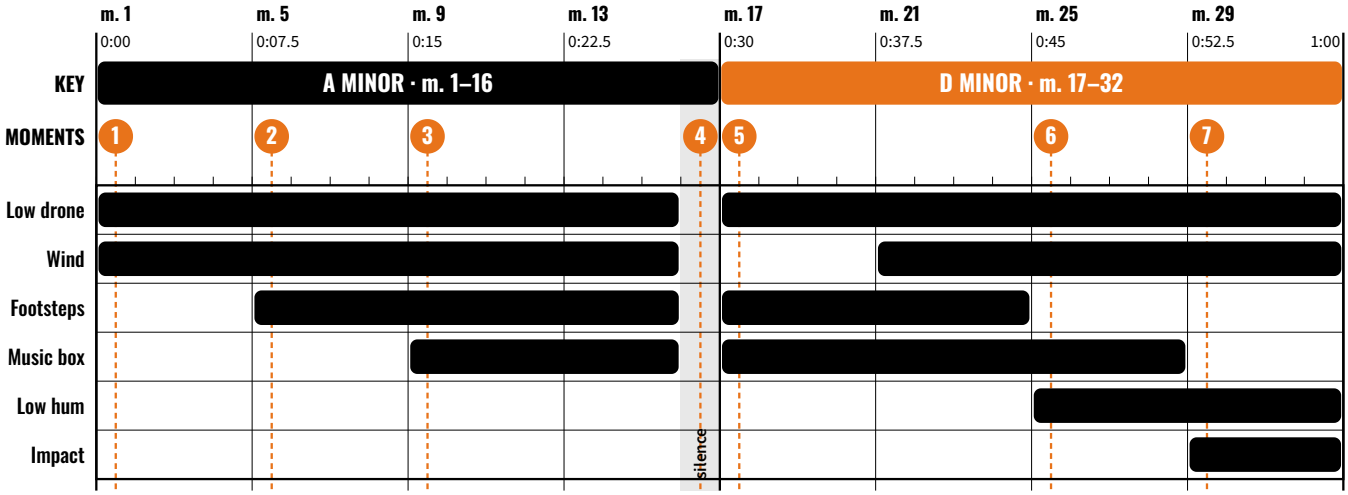

SPOOKY TUNES

Example notes · a worked 32-measure score

EXAMPLE

Teacher

Use this to model the score on Days 3–4 or as a reference while you circulate. It is one possible answer for a 60-second clip at 128 BPM, not the answer: your video's moments will be different, and every student's score should sound different.

THE MOMENTS ·

1 **m. 1 · 0:00** Drone and wind fade in

2 **m. 5 · 0:07.5** Footsteps enter, close and dry

3 **m. 9 · 0:15** Music box melody in A minor, with delay

4 **m. 16 · 0:28.1** Everything stops: one measure of silence

5 **m. 17 · 0:30** Visual cut: the drone moves to D (a change of key)

6 **m. 25 · 0:45** Low hum enters; the reverb send swells up

7 **m. 29 · 0:52.5** Impact hit; its reverb tail rings to the end

WHAT A 5 SOUNDS LIKE

The music changes because the picture changes; the biggest change lands on a cut; near sounds are dry and far sounds are wet; one moment of real silence; and a student who can name two techniques and say why. Requirement check: 6 sources (3 library, 2 recordings, 1 download), 6 tracks to the reverb bus, 2 to the delay bus.

TRACK · SOURCE	NOTES	REVERB SEND	DELAY SEND	WHY
Low drone Logic library synth pad	A, then D at m. 17	-12 dB	off	The floor of the piece. It moves to D on the cut at measure 17, so the change of key is heard.
Wind Free sound-effects download	no key	-6 dB	off	Far away and very wet: it sounds like the whole forest.
Footsteps My recording: crumpled paper close to the mic	no key	-30 dB	off	Close and almost dry: right next to the listener.
Music box Logic library (celesta or music box)	A minor scale, then D minor	-14 dB	-18 dB	The only melody, and the main delay send: it echoes through the trees.
Low hum My own voice, pitched down	E and F, a half step that rubs	-8 dB	off	Unsettling texture. The pitch-bend wheel slides it between the two notes.
Impact Logic library hit	D (one hit)	-10 dB	-22 dB	One hit at the scariest moment, with a long tail that rings to the end.

Send levels are starting points for a demo, not targets. Trust your ears.
